The best way to remember design patterns

There are three basic classifications of patterns: Creational, Structural, and Behavioral patterns.

Creational Patterns

- Abstract Factory: Creates an instance of several families of classes
- Builder: Separates object construction from its representation
- Factory Method: Creates an instance of several derived classes
- Prototype: A fully initialized instance to be copied or cloned
- Singleton: A class in which only a single instance can exist

Note: The best way to remember Creational Pattern is by remembering ABFPS (Abraham Became First President of States).

Structural Patterns

- Adapter: Match interfaces of different classes
- Bridge: Separates an object's abstraction from its implementation

- Composite: A tree structure of simple and composite objects
- Decorator: Add responsibilities to objects dynamically
- Façade: A single class that represents an entire subsystem
- Flyweight: A fine-grained instance used for efficient sharing
- Proxy: An object representing another object

Note: To remember Structural Pattern best is (ABCDFFP)

Behavioral Patterns

- Mediator: Defines simplified communication between classes
- Memento: Capture and restore an object's internal state
- Interpreter: A way to include language elements in a program
- Iterator: Sequentially access the elements of a collection
- Chain of Resp: A way of passing a request between a chain of objects
- Command: Encapsulate a command request as an object
- State: Alter an object's behavior when its state changes
- Strategy: Encapsulates an algorithm inside a class
- Observer: A way of notifying change to a number of classes
- Template Method: Defer the exact steps of an algorithm to a subclass
- Visitor: Defines a new operation to a class without change

Note: Just remember Behavioral Pattern Music..... 2 MICS On TV (MMIICSSOTV).

:laugh:
